## Above Average Incidence of Acute Hepatitis A Virus Infections Press Release

**FOR IMMEDIATE RELEASE**  
22 September 2017

**CONTACT:** Sam Perez, Public Information Officer  
Tel: 831-637-5367

**SAN BENITO COUNTY, CA.** California is experiencing an increase in cases of hepatitis A infection. Currently there are 525 confirmed cases of hepatitis A throughout California and 17 deaths. Outbreaks have been declared in San Diego and Santa Cruz Counties.

Although there are no confirmed cases of hepatitis A in San Benito County, health officials are proactive in conducting prevention and control measures including providing hepatitis A vaccine to at-risk individuals, including homeless persons and/or illicit drug users. "We are using a number of strategies to vaccinate the high-risk population, including sending public health nursing teams directly to homeless encampments. We have also developed and distributed recommendations and educational materials for clinicians and businesses providing services to at-risk populations", said Dr. Newel, San Benito County Public Health Officer. "We plan to install at least six hand washing stations and portable toilets in locations most accessible for at-risk populations; and are recommending additional cleaning procedures effective at inactivating hepatitis A virus for public toilets."

The hepatitis A virus can spread through contaminated food or water. The virus can also spread by having sexual contact or sharing drugs with someone who is infected. Those most at risk include: travelers to areas with high or intermediate rates of endemic hepatitis A; men who have sex with men; users of injection and non-injection illegal drugs; persons with clotting factor disorders; and household members or caregivers of persons infected with hepatitis A.

Symptoms of hepatitis A include: jaundice (yellowing of the skin and eyes), fever, fatigue, loss of appetite, nausea, vomiting, abdominal pain, dark urine, and light-colored stools. Symptoms usually appear over a number of days and last less than two months. However, some people can be ill for as long as six months. Hepatitis A can sometimes cause liver failure and even death.

To prevent the spread of hepatitis A infection: get the hepatitis A vaccination; wash your hands frequently, especially after using the bathroom or changing diapers, and before handling food; do not have sex with someone who has a hepatitis A infection; use your own towels, toothbrushes and eating utensils; and don't share food, drinks or smokes with other people. Waterless hand sanitizers are not effective against hepatitis A virus, which is a hardy virus and difficult to inactivate. Therefore, washing hands thoroughly with soap and water is an important prevention and control measure.

Press Release  
22 September 2017

Above Average Incidence of Acute Hepatitis A Virus Infections

Individuals are recommended to check their hepatitis A vaccination status and talk to their health care providers about the risks for hepatitis A. Persons planning an international trip should check the CDC Travelers' Health website (<https://wwwnc.cdc.gov/travel>) to see if hepatitis A vaccination is recommended for the intended destinations.

Hepatitis A vaccine is available at many doctors' offices and clinics and at some retail pharmacies. For persons without health insurance or Medi-Cal, vaccine is available at San Benito County Public Health Services. For additional information please call (831) 637-5367 or go to our website at <http://hhsa.cosb.us/divisions/public-health>.
